

Embedding a Brightcove player

On sites that don't have full videos integration (like the 2.0 lite sites), we often need to embed a video player. Here are instructions on how to do it.

Embedding a playlist player

1. Open the [Brightcove web app](#) and navigate to the player you want to embed.
2. Click the **Get Code** button in the bottom right.
3. Click **Copy Code** in the dialog box.
4. Paste the embed code somewhere you can edit it.
5. Add the following `<param>` tag with the ID of the playlist you want to embed.

```
<param name="@videoList" value="1191339131001" />
```

6. In Drupal, go to **Site Building -> Blocks -> Add Block**
 - Under **Block Description**, enter a valid description (eg "The Firm Mini-player Embed").
 - Under **Block Title**, enter the title you want. If you don't want a title, enter **<none>**.
 - Under **Block Body**, set the **Input Format** to **None (unfiltered input)** and paste in your embed code (make sure it has the additional `<param>` tag).
 - Configure the block visibility settings the way you would any other block
7. Save the block, then place in the desired region.

You can use Quick Publish to skip the manual insertion of the `@videoPlayer` param - see <http://support.brightcove.com/en/video-cloud/training-videos/quick-video-publishing>
