

Brightcove Tools

Media Sharing

Media sharing is a feature of Video Cloud that lets publishers share videos with other publishers, enabling you to more easily manage videos across multiple accounts. Media sharing puts you in control of sharing relationships with other accounts, and helps you provision copies of your videos to these accounts. These shared videos can then be programmed and used independently in other affiliate Video Cloud accounts. You can use media sharing to a full episode into the SPT-Secure account and then share it out to differently-configured regional accounts which will add language-specific tags and sub-titling.

Sometimes the source file of the video needs to be updated or replaced. This requires a *forced reshare* which is not available in the Brightcove admin - only the API. So we've created a useful tool for that here:

Video Checking Tool

Use the Video Checker tool to find out why a video might not be playing. It displays the response when a template error occurs in Brightcove. This is good for testing a video's status, whether geo-filtering is applied, etc:
